

APPENDIX A - ACCESS DATA AND ZONE DIAGRAMS

A. ZONE LOCATIONS

The 737-600/700/800/900 zone diagram is divided into 8 major zones. These zones encompass the Fuselage, Empennage, Power Plants and Struts, Wings, Landing Gear and Doors. A further breakdown in zone identification is achieved by subdividing the individual major zones into subzones. The 737-600/700/800/900 aircraft is divided into a total of 228 zones. The zones are illustrated and described in the Maintenance Manual and in the Introduction of the Illustrated Parts Catalogue.

1. The major zone designations are as follows:

MAJOR ZONE	DESCRIPTION
100	Lower Half of Fuselage
200	Upper Half of Fuselage
300	Empennage and Body Section 48
400	Power Plants and Nacelle Struts
500	Left Wing
600	Right Wing
700	Landing Gear and Landing Gear doors
800	Passenger and Cargo Compartment Doors

2. The zone designation in each illustration refers to a particular major zone. When the zones are identified, the following criteria was applied.
 - A. Where applicable, an odd number indicates a left side zone and an even number indicates a right side zone relative to the fuselage or nacelle centerline.
 - B. The sequence of zone numbers runs from inboard to outboard and front to back in the wing and horizontal tail; front to back and away from the floorline in the fuselage and from root to tip in the vertical fin.
 - C. Major structural components, passenger cabin doors, cargo doors, landing gear doors, rudders, elevators, flaps, ailerons, spoilers and leading edge devices have individual zone numbers.

B. IDENTIFICATION OF ACCESS DOORS AND PANELS

All maintenance access doors, service doors, fillets and fairings, are identified as follows:

1. The identification is prefixed by the three digit zone number that designates the smallest zone in which the door is located.
2. A two-character suffix will normally be used and consists of a primary identifier and a locator. If an access panel is identified out of sequence, a third letter "X" will be added to the suffix.
3. The first character is the primary letter, which will identify the door in a logical sequence. For example, inboard to outboard or front to rear, starts alphabetically with the letter "A" within each zone. For internal & special access requirements, the first character is a digit between 1 and 8, which refers to the major zone most applicable to the requirement.

4. The second letter locates the door in relation to the airplane.

For example:

T - Top

B - Bottom

L - Left

R - Right

Z - internal

C - Ceiling

F - Floor Panels

G - Floor Panels (used when "F" sequence designation is exhausted)

S - Sloping Sidewall

W - Sidewall

5. The third letter "X" is added to indicate that the two letter suffix is not in alphabetical sequence.

6. The following are examples of access door and panel identification:

Door or Panel Number (Zone) + (Suffix)		Identification
541	RT	(Top of Wing, left)
631	AB	(Bottom of Wing, right)
324	AL	(Vertical stabilizer - Left side)
324	AR	(Vertical stabilizer - Right side)
136	KZ	(Center Wing Tank, Internal)
121	PW	(Fwd Cargo Compt Sidewall Liners - Left Side)
121	DC	(Fwd Cargo Compt Ceiling Liner - Left Side)
121	HF	(Fwd Cargo Compt Floor Panels - Left Side)
500	1	(Drain/Purge Left Wing Main Fuel Tank)

7. Cabin entrance doors, cargo doors and landing gear doors will be identified by the zone number since each is a zone in itself. However, access panels within entrance or cargo doors will be identified in the usual manner.
8. The letters I and O will not be used.
9. Tank vents are not assigned access identification.

10. Doors on the fuselage centerline are assigned the left panel zone number.
11. Corresponding access panels on the opposite side of the airplane normally have the same suffix letter designator even though the zone numbers will differ.
12. When a door is located on a larger door, the larger door is identified first.
13. For doors in more than one zone, the lowest zone number involved is used.
14. A door located on a zone boundary takes its number from the zone in which it is removed or opened. Internal & special access requirements will be identified by the zone to which they give access.

C. ACCESS DOORS AND PANELS INFORMATION

1. Panel description/Provides access to:

A brief descriptor of the panel/door is included. "Provides access to" information is included in this column if the primary access to a significant system/component or structure is through the applicable panel/door.

2. Labor-hours OPEN/CLOSE

- A. Open/close labor-hours are provided for most access panels in this section of the MPD. "TBD" appears in this field where labor-hour data has not been calculated and verified. A standard labor-hour factor was used in calculating the man-hour estimates listed in this section. This factor was then multiplied by the number and type of fasteners for a particular panel. Airline operators may need to factor these estimates based upon their own airline operating procedures. Labor-hour calculations are based on the following assumptions:
 - a. All maintenance stands in place.
 - b. Mechanic at workstation.
 - c. Power tools available and hooked up.
 - d. 25 fasteners or less removed manually.
 - e. 26 plus fasteners removed using power tools.
 - f. Sealant removed and installed.
 - g. Even though normal airline operations utilize two mechanics for larger access panel removals, the calculations listed are based upon one mechanic removing all fasteners. Airline operators will have to monitor those occasions where two mechanics are utilized and factor the time accordingly. The "Size of Panel" and "Fastener Quantity" information included in this section may be useful in determining the number of mechanics required for panel removal/installation. The above assumption will keep the labor-hour estimates standard without conditional variations.
 - h. Some panels with specific MM procedures are factored dependent upon the difficulty or complexity of the MM procedure. The general area of the airplane is taken into consideration (accessibility) and size of panel for estimates (I.E. vertical stabilizer).

- i. Labor-hour estimates are for new airplane first removal conditions. With airplane age and more frequent removal panel removal/close estimates should be less.

D. SPECIAL ACCESS REQUIREMENTS

Special Access Requirements denote where access is required but a specific access panel does not exist. Special Access requirements are identified by a four-digit number. The first three digits are the zone number and the fourth digit is a sequence number within that zone. These Special Access requirements are needed to prepare the area to accomplish a Scheduled Maintenance Requirement. Table of Special Access Panel numbers are at the end of this section.

E. ACCESS DOORS AND PANELS ILLUSTRATIONS

The information for access doors and panels is presented for the major zones and the number designation follows the same system as used in the zoning diagrams. Access door and panel designations are depicted in the illustrations which follow.

Access panels may vary among operators due to customer configurations. Each operator's Maintenance Manual contains the specific configuration data.
